

Energy Saving Tips

Cooling

- Fans blowing directly on you can make temperatures around you feel up to 4° cooler.
- Set thermostat at 78° or higher when the house is occupied and at 85° when vacant.
- Keep debris, high grass and other obstacles away from your air conditioner's condenser so that airflow to the unit is not blocked.
- Clean your AC condenser/evaporator coils at the beginning of the season.
- Clean or replace filters at least once a month.
- Caulk and weather-strip around your windows and doors.
- Shade your outdoor AC unit.
- Plant trees to shade your south-and west-facing windows.

Heating

Heating a home takes two to three times more energy than cooling a home, so the work you do could add up to significant savings during the winter months.

- Install plug outlet covers on any unused outlet. About 20 percent of the air that escapes your home escapes through outlet openings.
- If you have a fireplace, install a glass fire screen to keep heated air from escaping through your chimney.
- Insulate indoor water pipes in unheated spaces.
- Inspect insulation to make sure it's not blocking ducts or vents. Blown-in insulation can settle over time and may need to be fluffed up or increased.
- Set your thermostat at 68 degrees. For every degree you raise the temperature, you add 3 to 5 percent to your electric bill.
- If your home uses a heat pump, raise the thermostat setting two degrees at a time when adjusting the temperature. This will avoid running the compressor and supplemental heat at the same time.
- Air can enter and escape your home through cracks and gaps around windows, doors, and other areas. Effective caulking can help prevent this.
- Caulk when the temperature is over 40 degrees Fahrenheit. If the weather is too cold, the caulk may not adhere.
- Caulking should be used only on joints that don't open or close, such as the seam between a window frame and a wall.
- Although most caulk lasts at least 25 years, settling makes it necessary to check your home for cracks in the caulk every few years.

Insulation

- Find holes and patches in your house where air can invade and fill it up with plastics or weather strips so that your heating and/or cooling system will not be overworked.
- Remember to keep all doors as well as windows closed at all times.

Lighting

- Turn off lights when leaving a room for a short time.
- Keep the dust off lampshades and light bulbs. It can reduce lighting levels as much as 50%.
- Change your bulbs to fluorescent. Fluorescent light bulbs use 70% less electricity than regular light bulbs, give off five times more light, emit 90% less heat and last 10 times longer.

Water Heater

- Lower the thermostat on your water heater to 120°.
- During daily use, turn off running water when you're not using it (when soaping hands, brushing teeth, etc.).
- Wrapping your water heater with an insulation blanket can reduce its energy use by 10% to 15%.

Refrigerators and Freezers

- Set the temperature between 36° and 38°. Freezer temperatures should be between 0° to 5°.
- Thaw frozen foods in the refrigerator rather than on a countertop. Not only is it safer, but frozen items will help cool the refrigerator as they defrost and help reduce its running time.
- Freezers work better fully loaded, but remember to leave enough room for air to circulate.
- Make sure your refrigerator and freezer doors seal properly.

Cooking

- Microwave ovens use up to 70% less energy, cook food up to 75% faster, and produce much less heat than an electric or gas oven.
- Using covers on pots will bring liquids to a boil more quickly and allow continued cooking at lower temperatures, reducing energy use and heat in the kitchen.

Other Appliances

- Wash/dry full loads of clothes and use cold water as much as possible.
- Never put lamps, TV sets and other heat-generating gadget beneath a wall-mounted thermostat. Rising heat from these appliances may trigger your conditioning system to overwork.

We are the number one Title Company Texas.
Bring us your next transaction and find out why!

Declare Your Independence

We're local

You're moving to the Central Texas area from somewhere else – why is it important to use a local company? Because we specialize in knowing everything you need to know about your new home. We know Central Texas first-hand – the land, the people, the roads, the history.

We live here, work here and invest here.

Local doesn't mean small

Central Texas is known for its big-city ideas and small-town feel. That describes us at Independence Title pretty well. We're local, but we're also the largest independently owned title company in Texas. We have nine national underwriters to support us and a network of relationships to help facilitate your move, no matter how far you have to go to get here.

Glad to meet you.

Big doesn't mean impersonal

Every employee is one phone call away from our top executives, and all decisions are made locally. That means we deliver services and solutions that are timely and personal to your particular needs. We give you the full benefit of our expertise, care, and professionalism on every transaction. Each investment you make in real estate is important to you ... **and it's important to us.**

Make us your personal title company

If you're working with a Realtor, mortgage lender, or relocation department, tell them you prefer Independence Title.

Welcome
Home!
